```
[1]: # The Number Listing Program
# This program's purpose is to make the user store numbers in a list, wherein
    ↳ they can add new numbers, and remove stored numbers.

# list declaration
numbers = []
# loops until break
while True:
    # prints the choices of the program
    print("----- The Number Listing -----")
    print("1. Add a number")
    print("2. Present the list")
    print("3. Remove the last number")
    print("4. Exit the program")

    # asks the user for the choice
    choice = int(input("\n>>> Enter your choice: "))

# if user chooses 1, the program will ask the user to add a number to the list
    if choice == 1:
        numbers.append(input("Add a number: ")) # asks user for random number
        print("Your New List: ", numbers) #prints new list
        print("\n\n")

# if user chooses 2, the program will print the list of numbers
    elif choice == 2:
        print("This is the List:", numbers) # prints the current list
        print("\n\n")

# if user chooses 3, it will remove the last element of the list
    elif choice == 3:
        numbers.pop() # removes the last element of the list
        print("Your New List: ", numbers) # prints the new list
        print("\n\n")

# if user chooses 4, program will exit
    elif choice == 4:
        break #program exits
```

```
# if the user chooses anything other than the 4 choices, it will print "invalid_
↪choice"
else:
    print("INVALID CHOICE!!!\n\n")
```
